

PYRAMIDS SUMMARY:

This table summarises each listener's results - aerial height, pyramid size and the radio countries at each level.

E.g. Frantisek's column shows that 4 NDBs in Libya were logged at level 4 in his size 22 pyramid.

The 'aerial' height (countries with one NDB logged) should be the same as the pyramid base size, where possible.

The gaps in the table are where the program did not find that number of loggings for a radio country.

This may have arisen where a listener had shown two loggings of the same NDB,

or where a listener had allocated an NDB to the wrong radio country,

or where a listener logged one of the NDBs which can be associated with either of two USA States,

or where an 'aerial' had more than one NDB from the same country, or logging(s) from a country that also appeared in the base.

(I left otherwise-valid extra loggings in the combined results)
